

New customer-specific training courses

The Bosch Pharmaceutical Training Department in Crailsheim has been regularly supporting customers with multilingual courses on complex areas of technology. The main themes are the depyrogeneration tunnel, time-pressure filling systems and automation systems.

Technical enhancement courses for training in complex areas of technology increase the pharmaceutical training portfolio

In-house courses are also available on request; in these courses on-the-spot training is provided in small groups and answers to customer-specific ques-

tions take center stage. This fall we will extend the range to include our capsule filling machines, focusing on process optimization, malfunction search, preventive maintenance and automation. Perfect customization of all training courses enables us to provide made-to-measure training on all the customer's

business areas. Machine operators, technical support staff, automators, Engineering and Validation and/or Quality Departments are given optimal step-by-step introductory training, start-up support and on-the-job training as part of a product system change.

Ongoing support with machine-specific training systems.

Support is also provided in the form of complete training systems over the entire lifecycle of a machine. The training is optimally introduced into the project timetable and consists of training manuals, presentations, multimedia modules, train-the-trainer courses and final qualifications. This variety also allows us to develop blended-learning concepts. The tailor-made training products and technical enhancement course enable you and

your staff to “brush-up” on and continuously extend your technological skills. Our staff, who are specially trained for the pharmaceutical industry, look forward to presenting your individual training solution to you.
